

Open Science Grid

Open Science Grid

Outline

- OSCER, Fermilab, OSG
- Sharing of Software, Computing, Knowledge
- Futures

Fermilab

Open Science DOE Lab that supports world wide scientific collaborations of 1000s of physicists and a range of astrophysics, HEP, theory and accelerator science.

Accelerators Detectors Data Analysis
Energy Frontier Intensity Frontier Cosmic Frontier

Serves ~4,000 university users; internally ~200 in IT department: (Astro)Physicists, IT, Engineers, Computer & Computational Scientists. Participations in PhD programs in accelerator science; member of the DOE Computational Science Graduate Student Fellowship Program.

Open Science Grid

OSG

provides a cross-domain self-managed national ***distributed high-throughput computing facility...***

that brings together ***campus and community infrastructures at all scales...***

to provide services, support and facilitate the needs of **scientific and research communities at all scales...**

Does not own processing, storage, networking hardware.
Does not develop software.

Open Science Grid

Wide Area Science Distributed Computing Social Network

A Consortium with more than 100 institutions of Scientists, IT and Software Providers.

A 5 year funded project (\$6M/yr) across NSF and DOE SciDAC-2 with staff at 16 institutions.

Staff provides all aspects of the core distributed facility: software, operations, user and administrator support, security, training, collaboration with peers.

Consortium members make significant contributions. Most active are Physics Collaborations: HEP, NP, LIGO, who are prepared to collaborate with and support other programs and disciplines.

Active partnerships with European projects, ESNET, Internet2, Condor, Globus...

Virtual Organizations

OSG works with Virtual Organizations or Communities

There are 30 VOs in OSG spanning scientific, regional, campus, international and education,

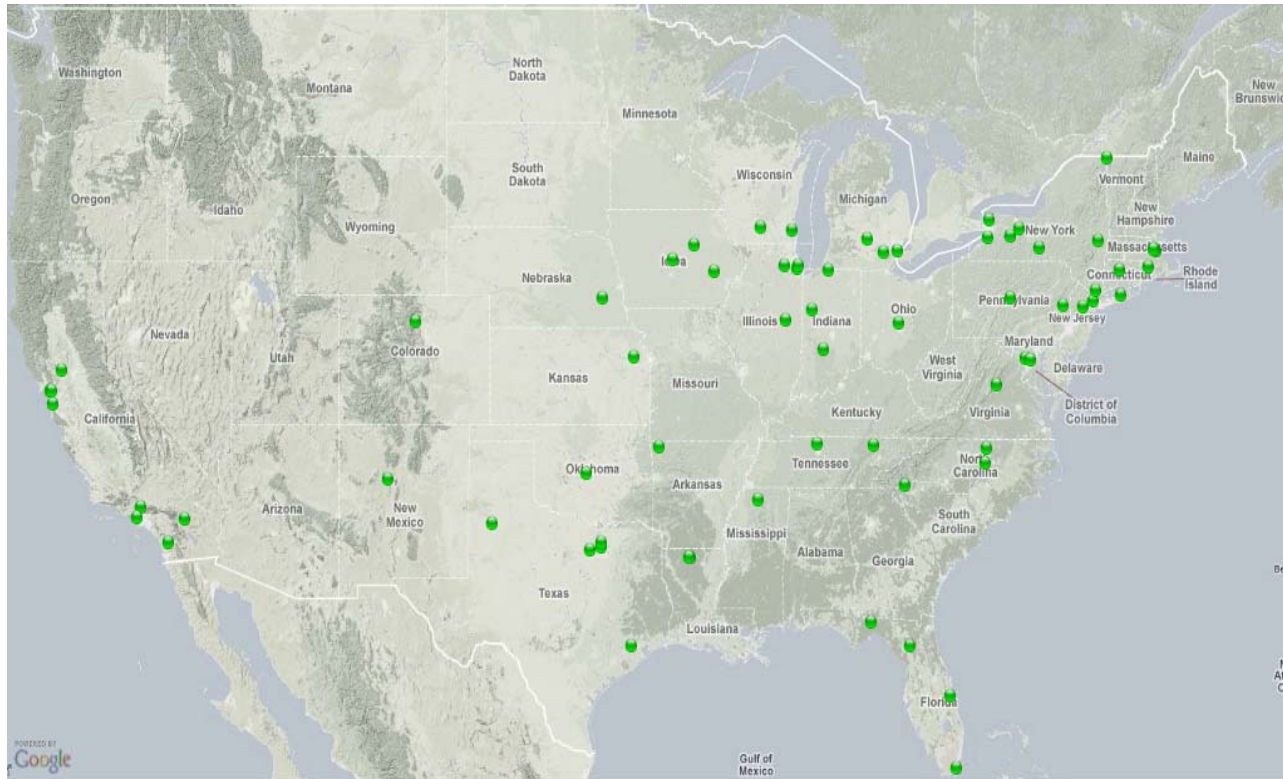

There are specific “OSG owned VOs” to accommodate individual users

Open Science Grid

Map of Accessible Resources

Why User map not yet feasible.

Several Current Models for Campus Grids (in OSG)

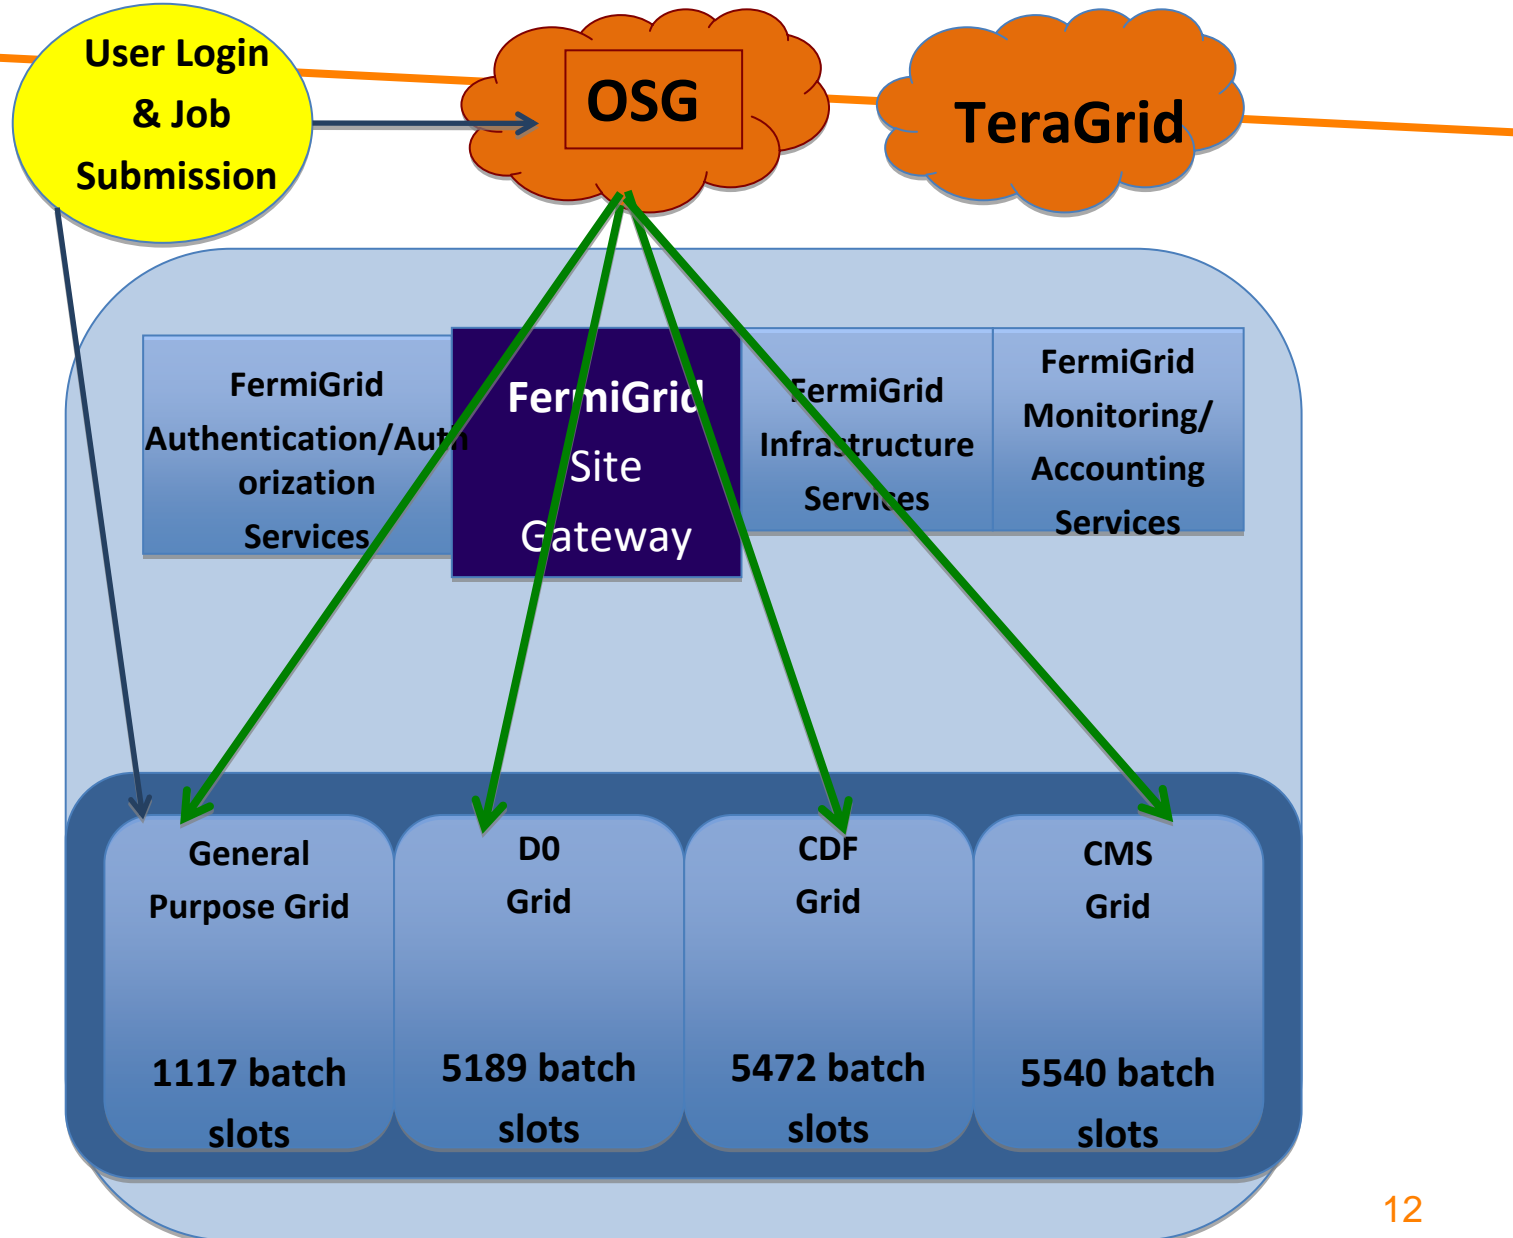

A Campus Condor pool with no OSG connectivity e.g. University of North Carolina,

Open Science Grid

FermiGrid : Cross Campus sharing with Each Cluster a Node on the Wide Area Grid

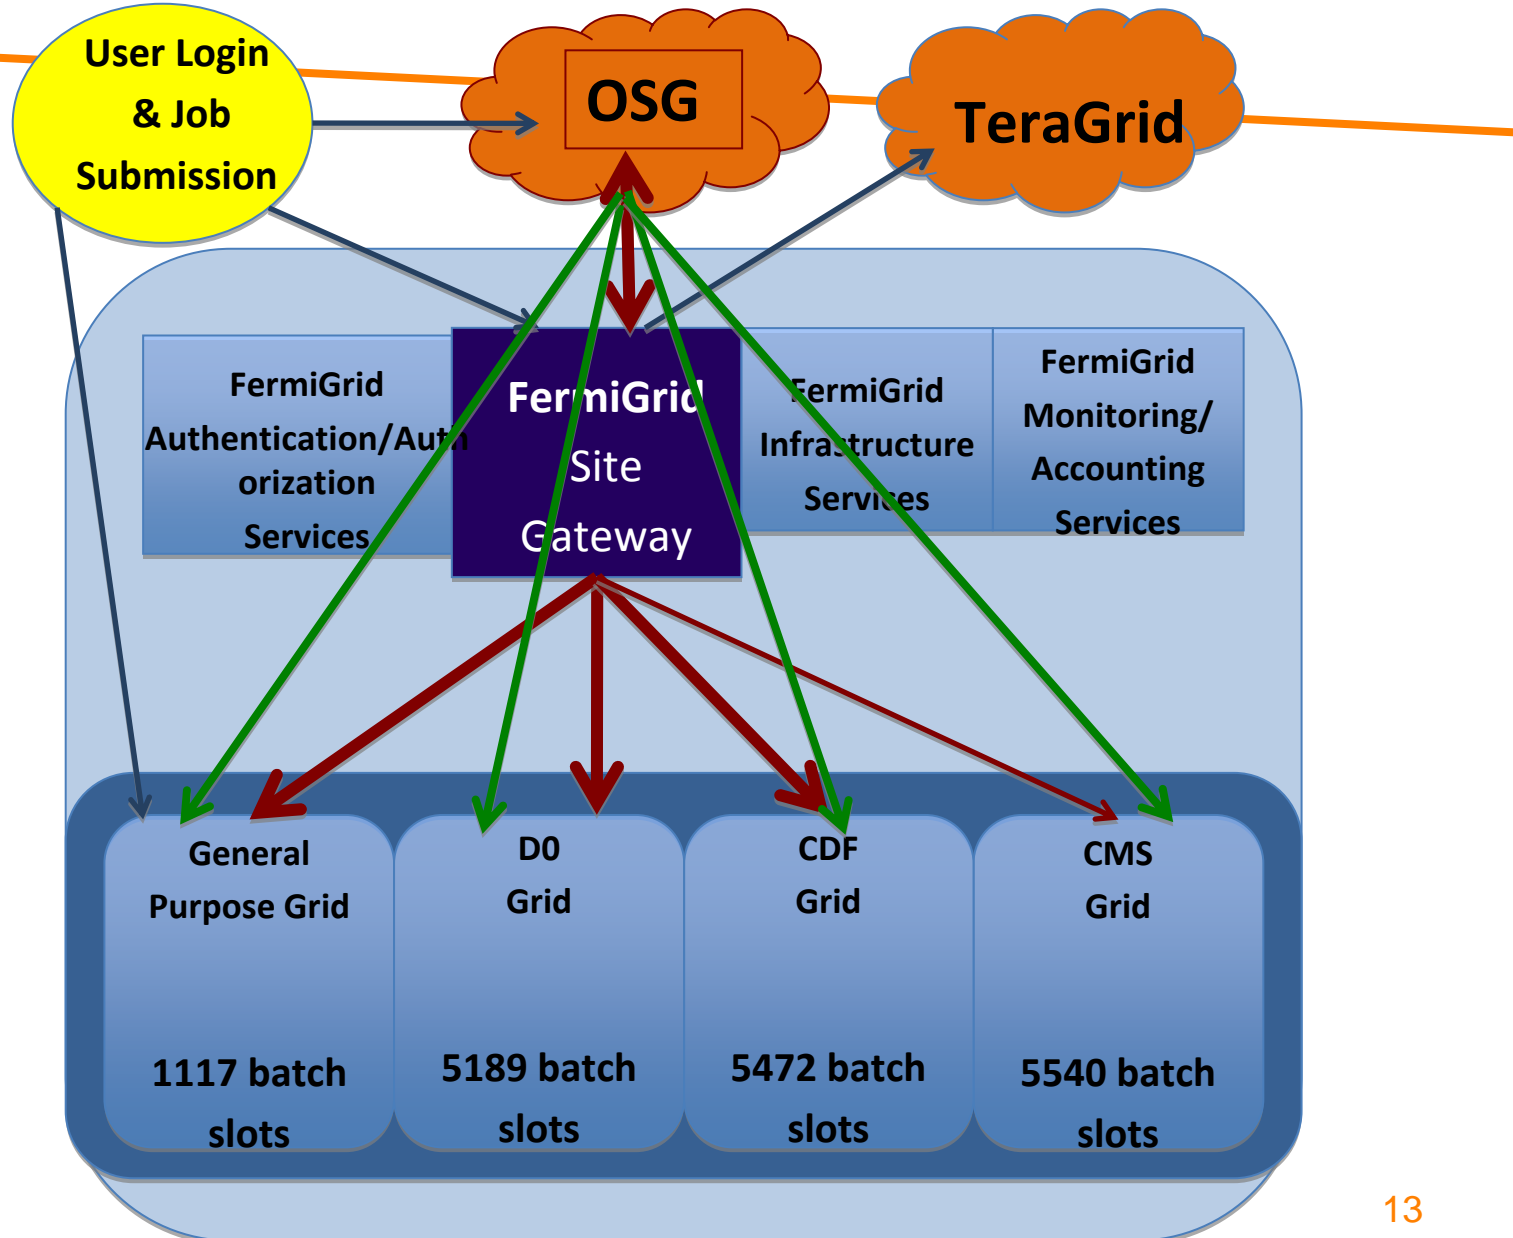

Total batch slots:
17,318

Open Science Grid

Cross Campus sharing with Each Cluster also a Node on the Wide Area Grid

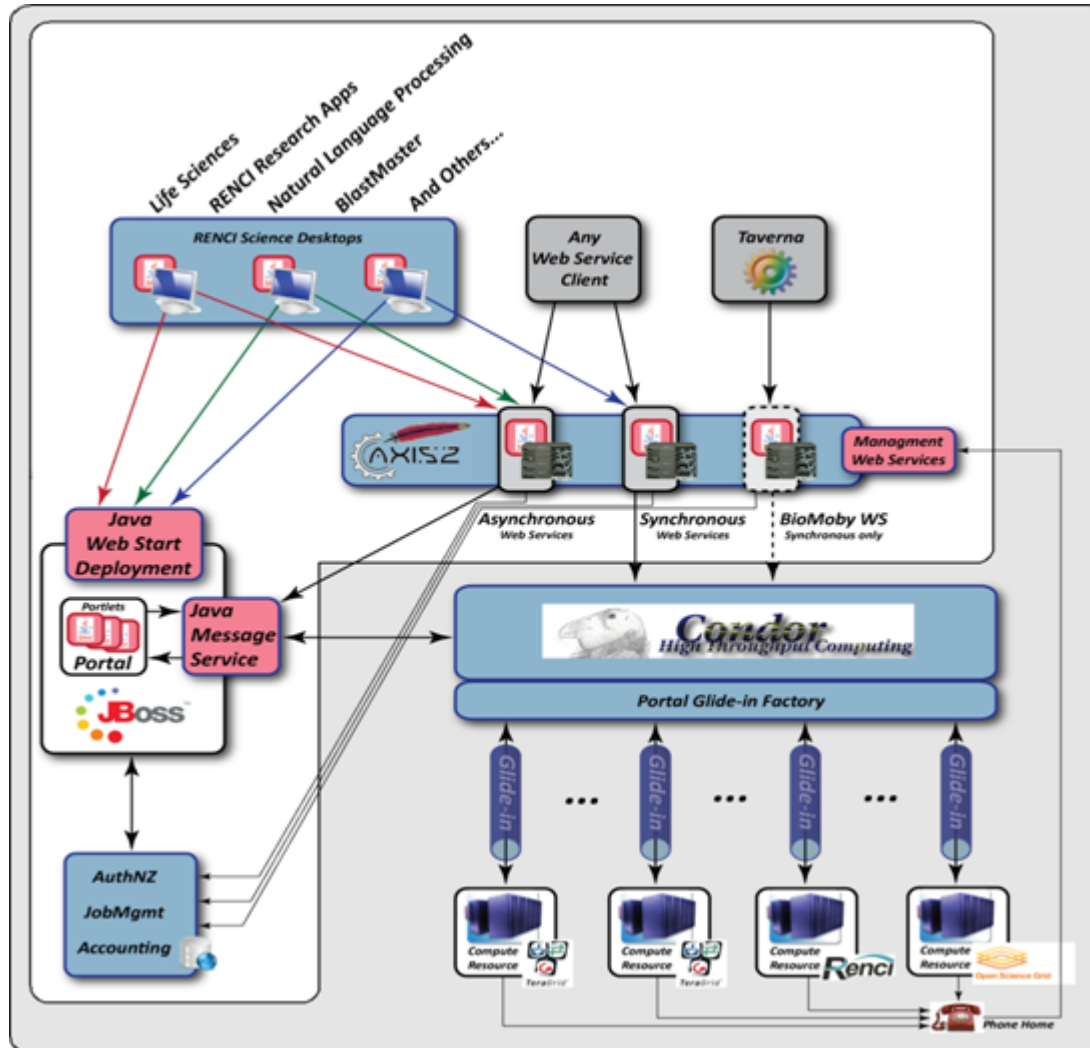

Total batch slots:
17,318

Open Science Grid

University of North Carolina

- A “mix” several clusters as one Condor Pool, with several “gateways” to the Wide Area Grid.
- Averaging ~100 CPUhours/hour for OSG use – sharing unused local compute cycles

OSG Helps

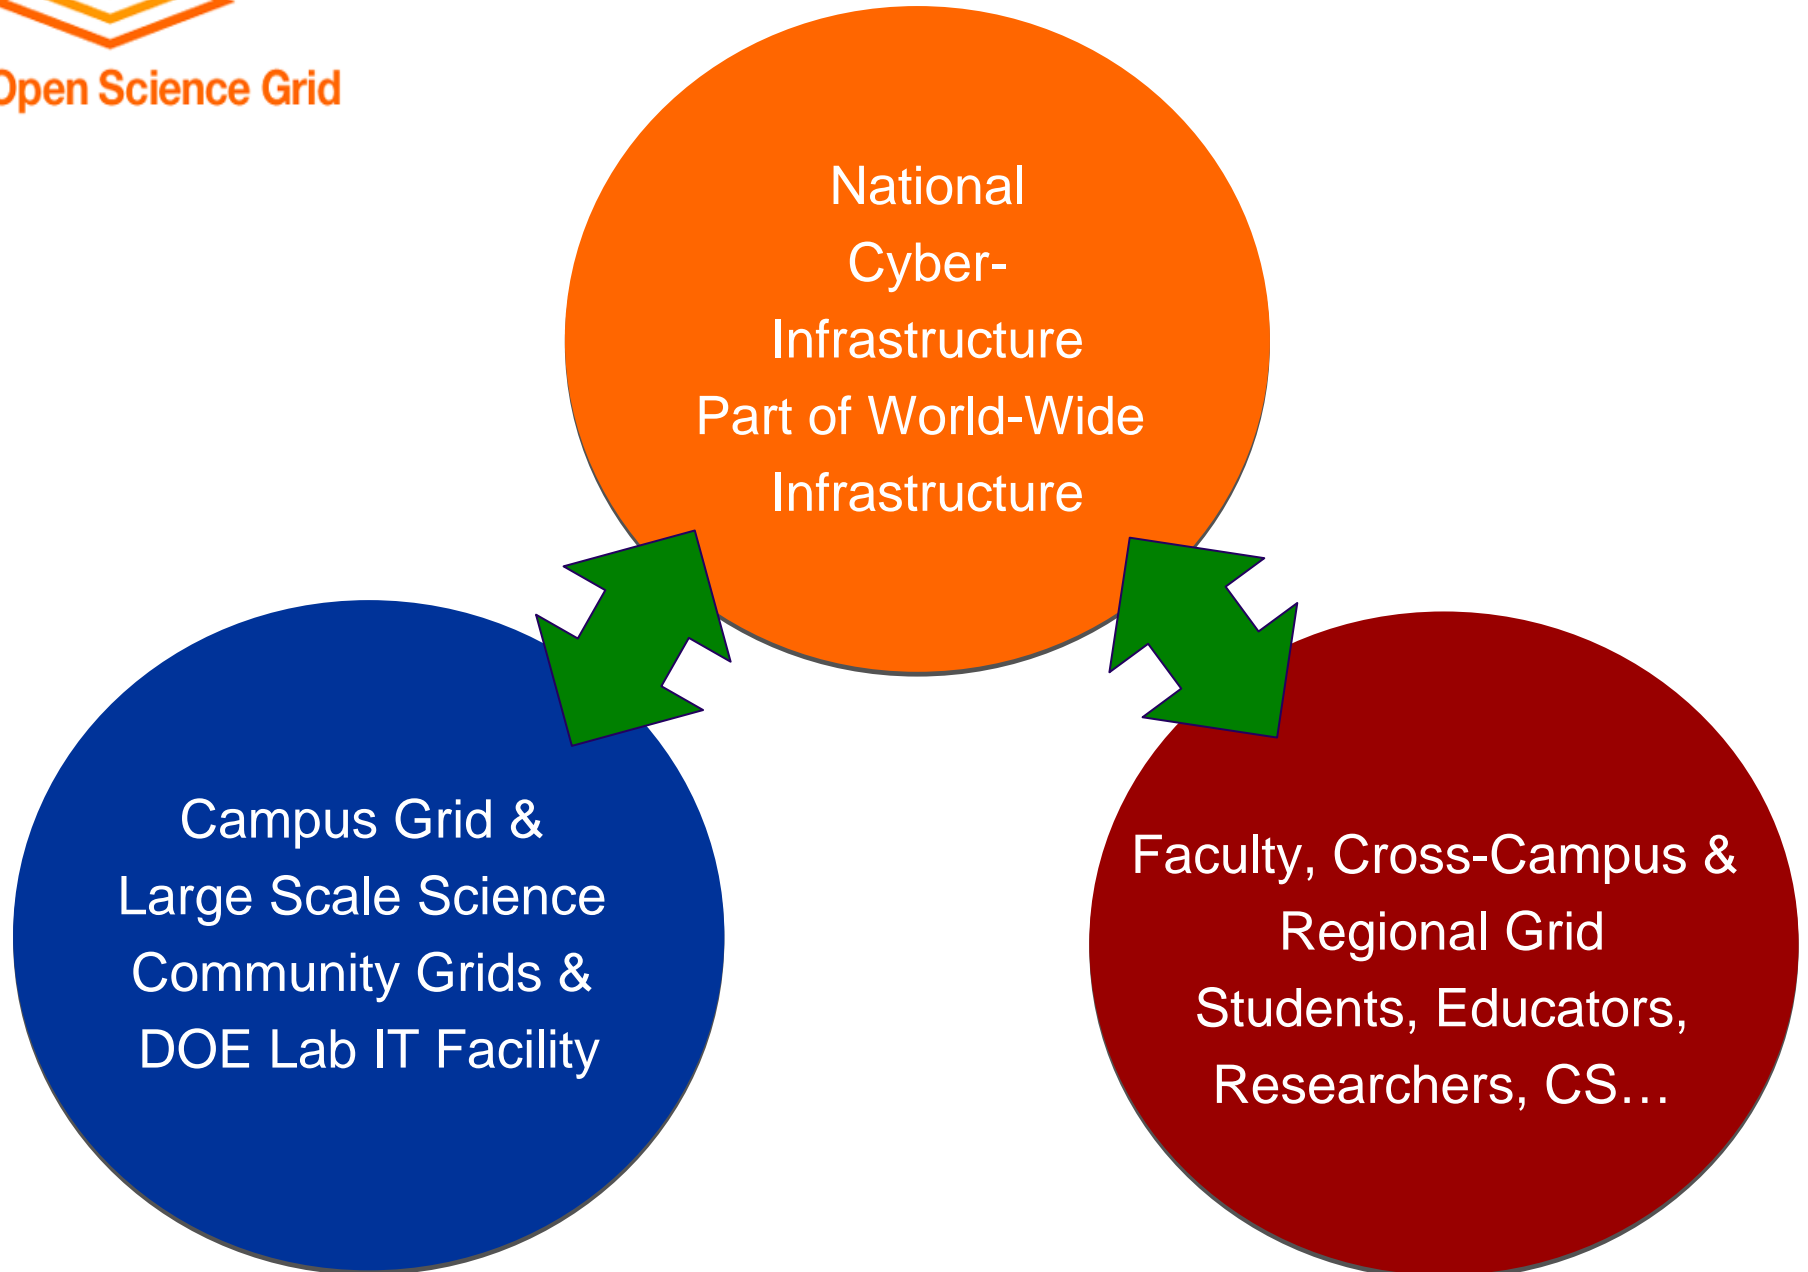

University researchers, faculty and students to **interact with “national CI”** including TeraGrid, OSG, other Regional grids etc.

Organize the campuses to change their culture and **Share Resources locally.**

Enable campuses and users to send jobs and data “on-demand” between the local and remote facilities, becoming **full members of the nation-wide shared cyber-infrastructure.**

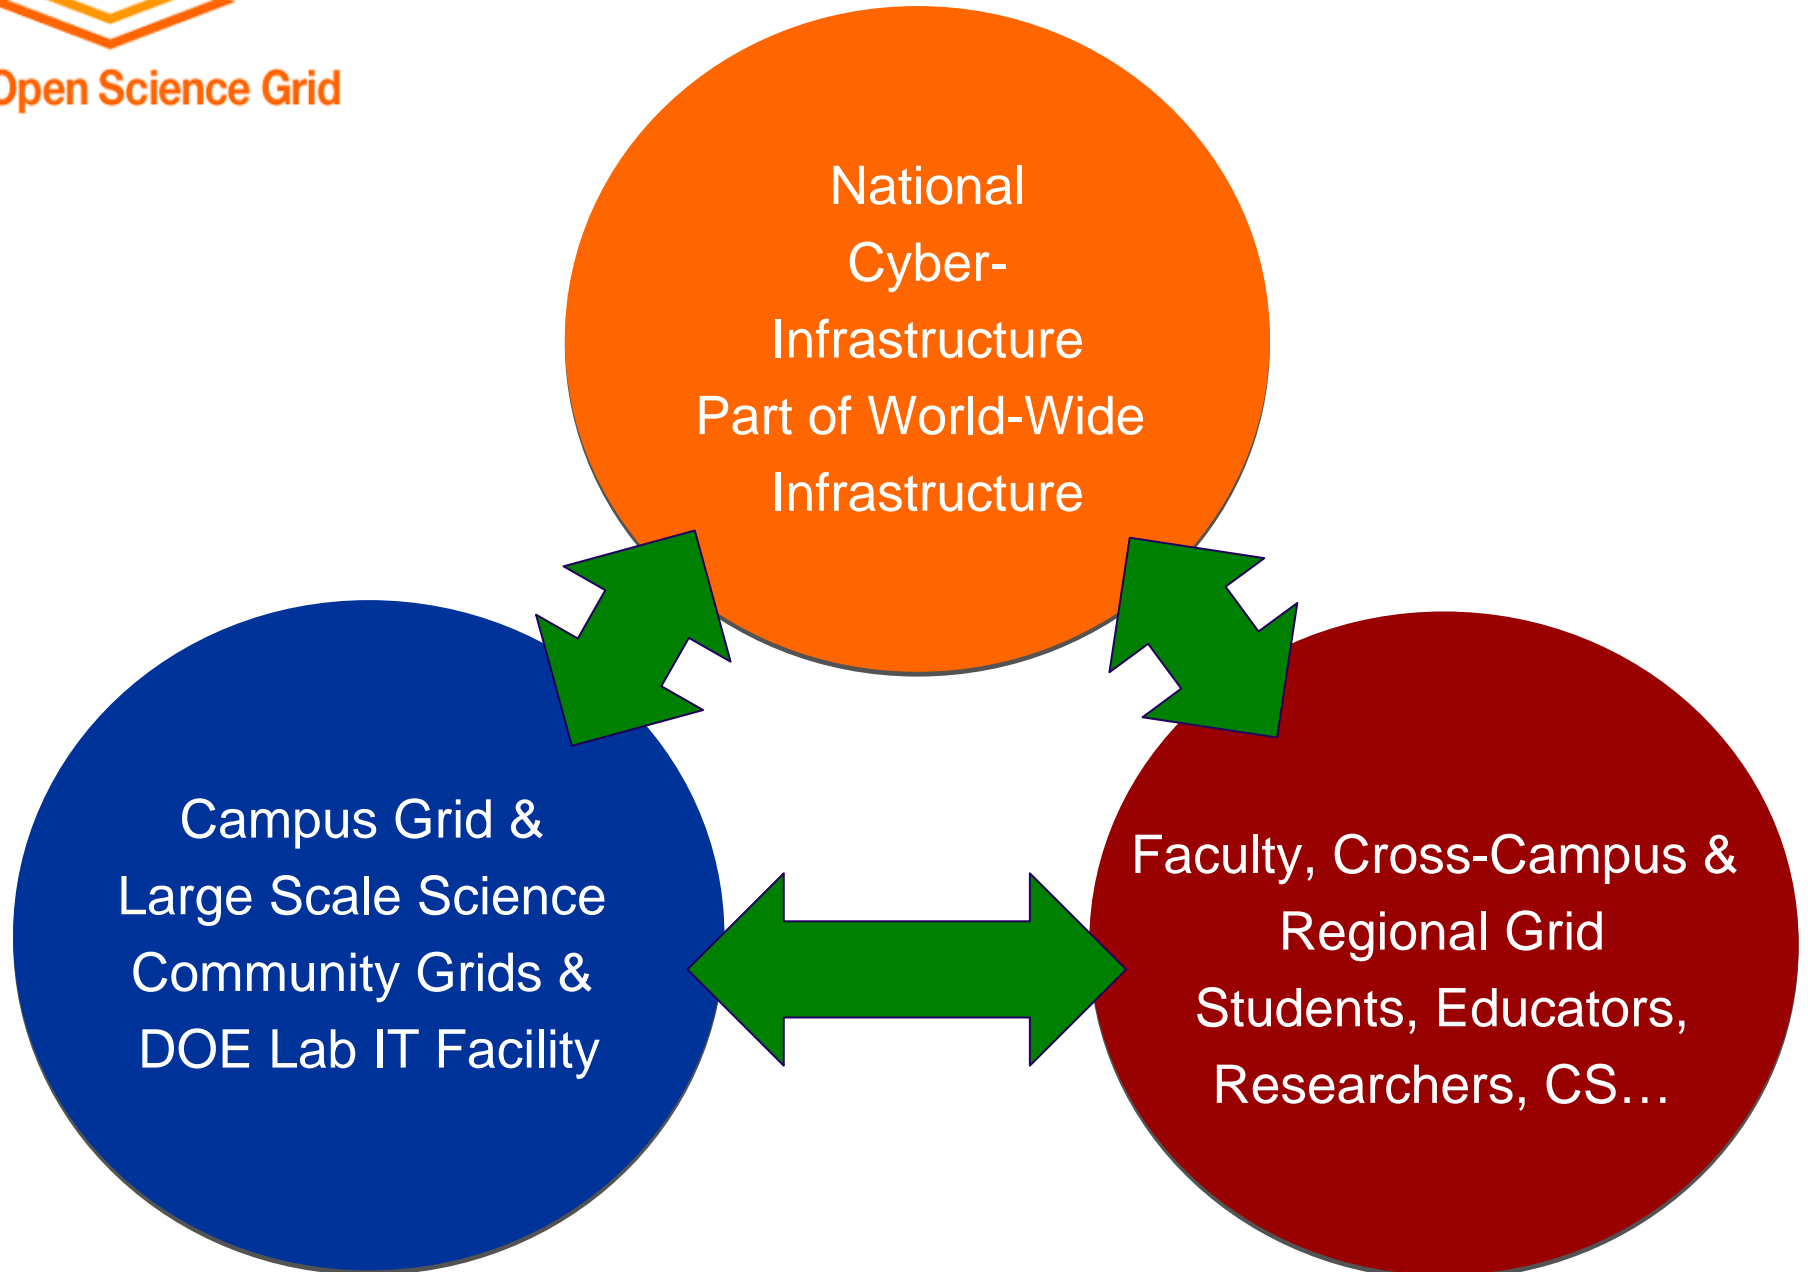

Open Science Grid

Open Science Grid

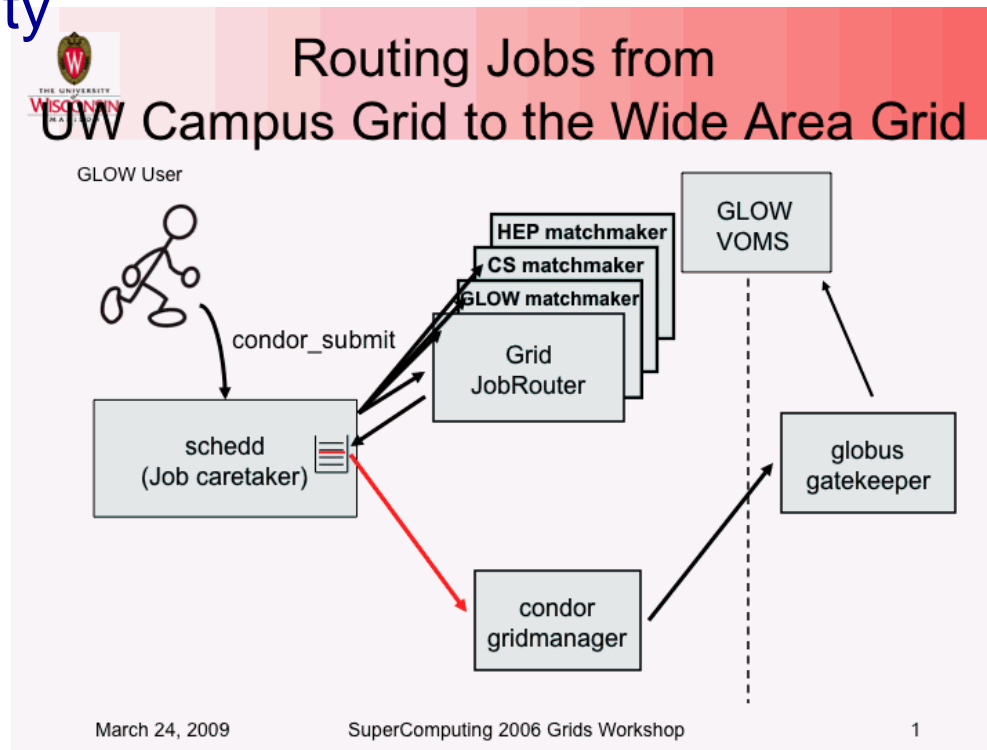

Condor job router – Grid Laboratory of Wisconsin

Automated way to let jobs run on a wider array of resources

Transform jobs into different forms

Reroute jobs to different destinations

Handle security

Open Science Grid

Glide-ins at RENCi

Temporarily join remote machines
into local Condor pool

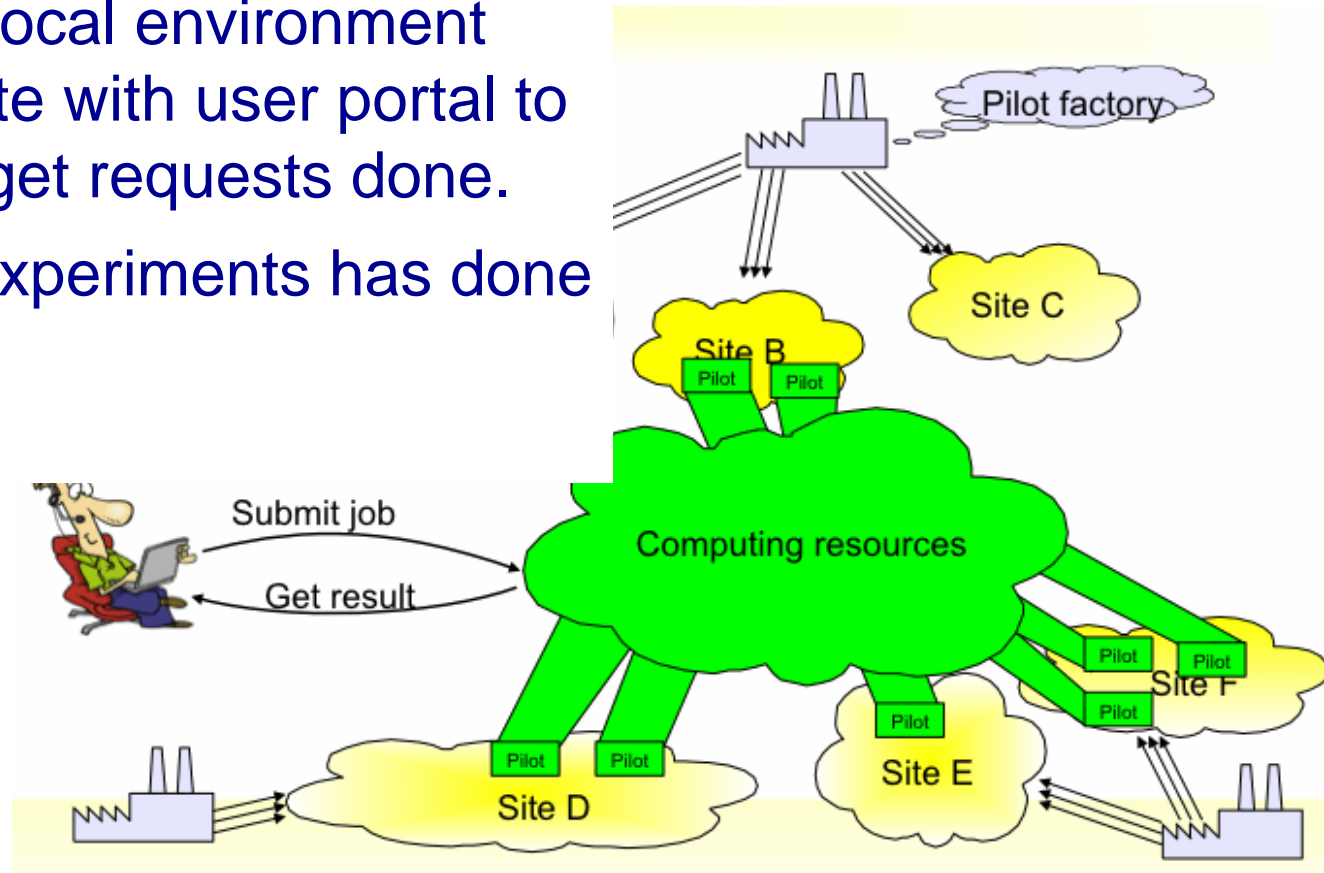

Overlaid Workspaces

Deploy “agents” on each site which learn about the local environment and communicate with user portal to most efficiently get requests done.

Each of the LHC Experiments has done this (differently)

Open Science Grid

Tevatron Physics

LHC Physics

Support for Science locally and broadly

Tevatron Physics

OU is a DZero Collaborator & important part of the Dzero Community SAMGrid, hosting data serving and catalog services.

CDF and D0 Experiments profit from LHC resources through adapting to and using OSG. Interesting issue how to “quantify” the value gained.

Brazilian institutions are important partners for both Fermilab and OSCER/DO.

RESULTS from Supporting the Search for the Origin of Mass

Shrunk the Higgs mass window from a few hundred GeV to ~ 40 GeV. Thus providing a 135GeV \pm 15% target region for future discoveries.

(press release March 2009).

- Direct Higgs Search at Tevatron
- now excluding high mass higgs.

- Top and W masses now known to
- 0.3% and 0.75% respectively.
- => Constrain Higgs via Quantum effects.

Open Science Grid

US LHC Physics

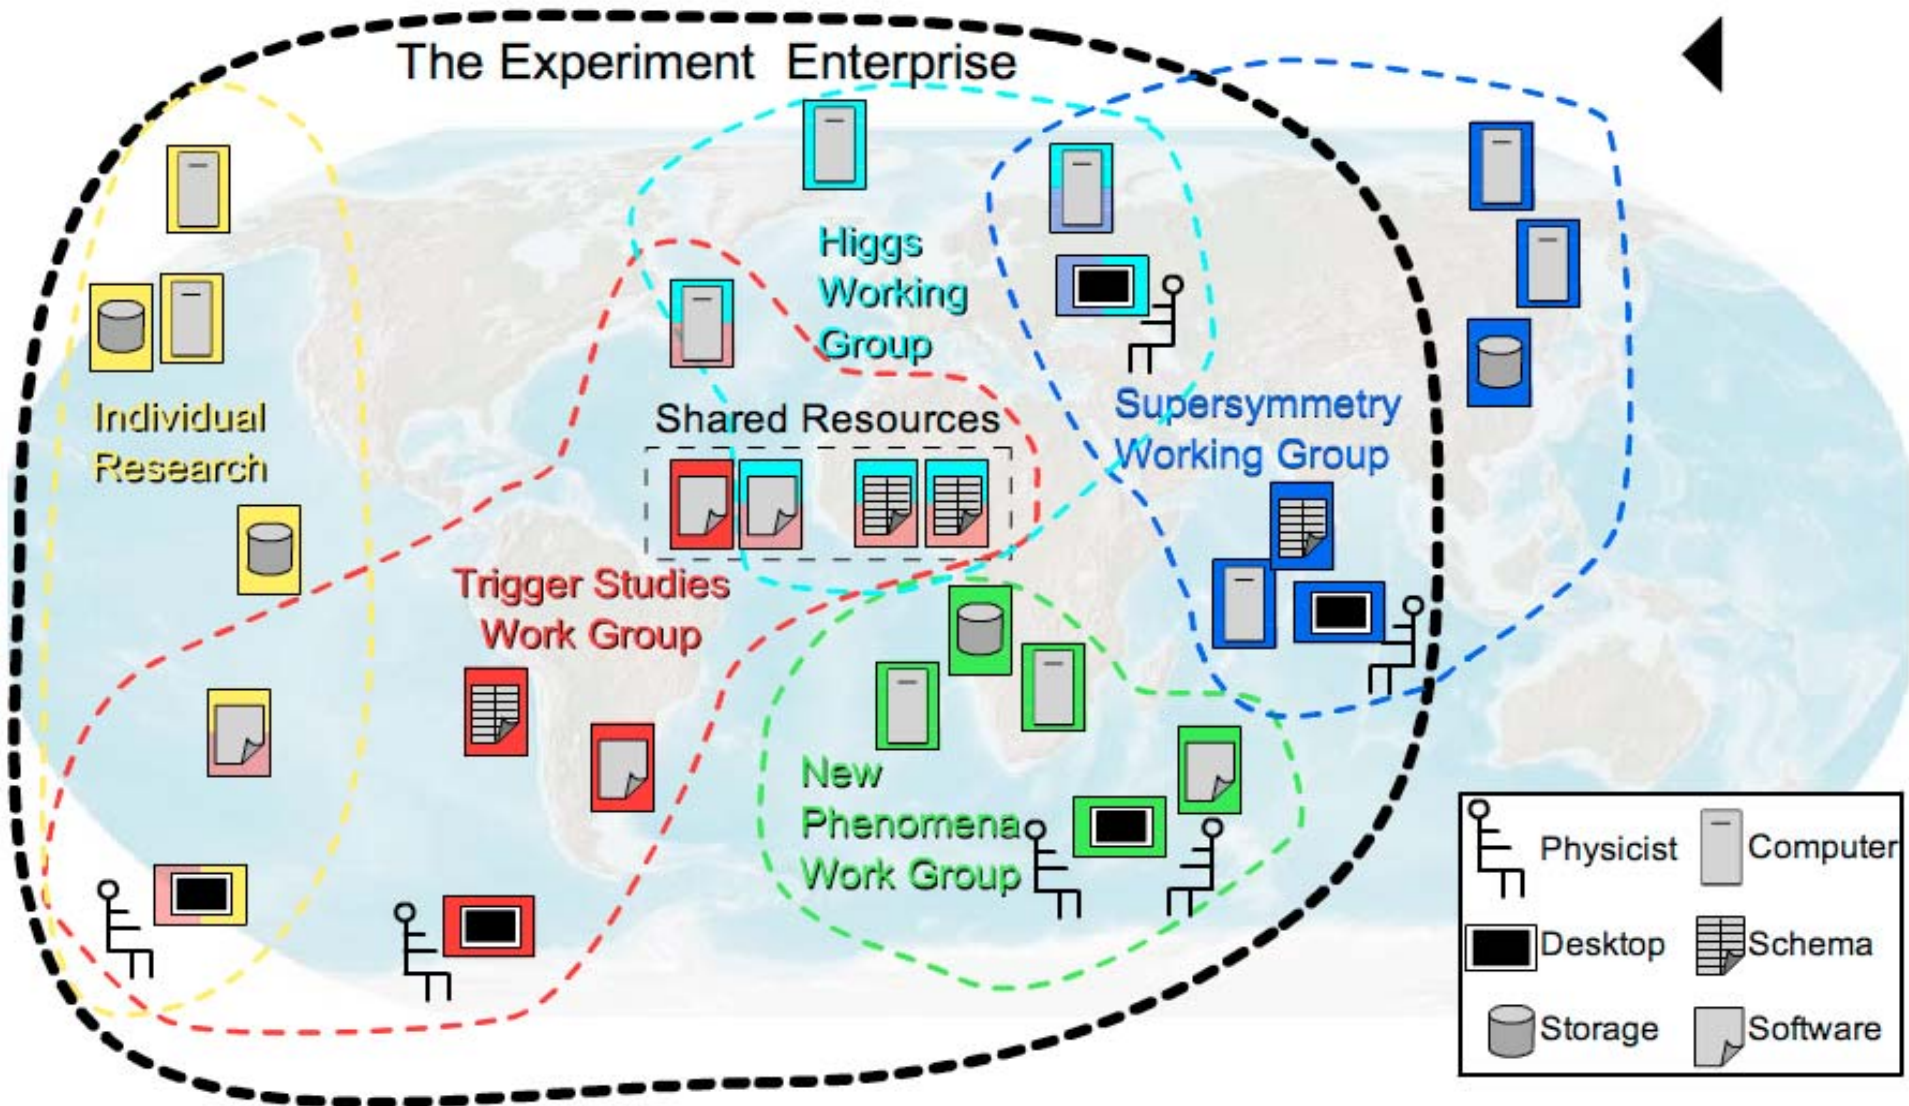

OU is US ATLAS Tier-2 site.

Fermilab is US CMS Tier-1.

OSG Contributes to WorldWide LHC Computing Grid by supporting US ATLAS and US CMS.

South/Central American institutions important collaborators for experiments and OSG.

The LHC: WorldWide Community Overlays on Shared Facilities (circa 2005 & still true today)

Open Science Grid

Scale of LHC Usage in US

ATLAS Operations on the OSG March 2009 thru August 2009

Across 3 DOE labs,
15 large Universities,
10 smaller Universities

Implies ~
300,000 jobs a day
3 TeraBytes moved each hour

CMS Operations on the OSG March 2009 thru August 2009

Open Science Grid

OSCER Contributes

User Communities (from 2008 talk)

- Aerospace & Mechanical Engr
- NEW! Anthropology**
- Biochemistry & Molecular Biology
- Biological Survey
- Botany & Microbiology
- Chemical, Biological & Materials Engr

Open Science Grid

Once applications are adapted, communities ramp up to use multiple sites quickly

IceCube, a telescope under construction at the South Pole, will search for neutrinos from the most violent astrophysical sources: events like exploding stars, gamma ray bursts, and cataclysmic phenomena involving black holes and neutron stars.

Sharing of Software and Knowledge

Computing, data, storage rely on software to be useful.

OSG provides a common software set which is packaged, tested, distributed for many different OS and provided in different configurations for Users, Communities, Processing, Storage, and Data servers.

Software built and tested on ~15 Linux variants.

System testing done on separate test Grid with more than 15 sites and 10 science communities participating

Open Science Grid

Bridging software ensures Uniformity presented to the User across Multiple Software Implementations

Open Science Grid

Software Components

Why Depend on OSG for Software?

User communities have long term needs for distributed systems support and operations which can be supplied by dedicated organization.

Common software is more efficiently tested, packaged evolved, supported across multiple s/w developers and OS versions.

Change and evolution is managed by experts and knowledge is transferred more efficiently.

Central Security Organization helps part-time administrators, new recruits, and timely, consistent broad response to incidents.

“Providing the security framework that promotes autonomous and open science collaboration...”

Ensuring security is not compromised because of Open Science

Ensuring science is not burdened because of security

Mine Altunay,

The OSG Security Officer. She is a Computer Scientist at Fermilab

OU is an Early Member

Many contributions

- Exemplar Cross-Campus organization and sharing of computing.
- Testing of new versions of Software
- Allowing computing and caches to be used by many different communities
- Bringing new applications to the table locally and across DOSAR sites.
- Contributions to software including accounting, metrics
- Support for Sao Paolo regional grid.

Looking forward to more to come!

Horst Severini is the grid computing coordinator of the Oklahoma Center for High Energy Physics at the University of Oklahoma in Norman . He is in charge of the operation of the OU part of the US ATLAS Southwest Tier 2 Center, which also includes UT Arlington and Langston University . Besides ATLAS, the OU High Energy Physics (OUHEP) group is also a member of the D0 and DOSAR VOs within OSG.

OUHEP has several OSG CEs installed, most of which run jobs for the ATLAS, D0 and DOSAR VOs. Horst and his OUHEP colleagues also maintain an OSG testbed site, always an early adopter of new OSG integration releases, that allows them to help debug and fix integration and deployment issues. Furthermore, they work with the OSG accounting and monitoring groups on software tests.

Horst is also the associate director of the OU Supercomputing Center for Education and Research, where he manages the OU Condor project. The project aims to assemble all OU campus student lab PCs into a campus Condor pool, which is also already an

iSGTW INTERNATIONAL SCIENCE GRID THIS WEEK

[Home](#) > [iSGTW 7 October 2009 Astronomy issue](#) > Feature - An unexpected bounty of Near Earth Objects

Feature - An unexpected bounty of Near Earth Objects

While scanning through images from the [Sloan Digital Sky Survey](#), Fermi National Accelerator Laboratory researcher Stephen Kent noticed something unusual — a few extended streaks scattered among the millions of point-like stars and galaxies.

Kent realized the streaks were produced by Near Earth Objects (NEOs), asteroids or extinct comets whose orbits bring them close to Earth — close enough that they could collide. They appear as streaks because the closer an object is to Earth, the more quickly it moves across our sky. That's why the patterns of distant stars appear unchanged over the course of our lifetimes, whereas our closest neighboring planet, Venus, moves noticeably with respect to the stars from right to left.

Because the NEOs detected by the SDSS are so close to the Earth, they moved across the telescope's field of view during the 52-second camera exposures, creating streaks against the far-away stationary background objects.

During its eight years of operation, the SDSS obtained images of more than a quarter of the night sky and identified almost 400 million objects. Although the survey was designed to detect stars and galaxies and determine their properties, it also helped identify more than 100 NEOs.

Prioritizing the handful of NEOs in the millions of objects in the SDSS dataset was a computationally challenging task, however, and Kent turned to the [Open Science Grid](#) to speed up the process.

"It was an enormous job to whittle down the forest in order to pick out the interesting trees," Kent said. "The project was extremely well suited for the grid because we were able to break the large volume of data into many small pieces and parcel them off to different computers on the grid."

Image of a near-earth object detected by the Sloan Digital Sky Survey. The streak, red and green, shows the object as it moves through three of the five SDSS filters over a period of five minutes. The two white objects are distant stars. Image courtesy Stephen Kent.

This graph depicts the near-earth objects found by four sky surveys, including Kent's grid-assisted search of the SDSS data. It shows that large NEOs such as the K-T impactor that wiped out the dinosaurs 65 million years ago are quite rare. The SDSS NEO Survey, indicated by the thick red line, searched for the more common smaller objects. Although these are not small enough to cause mass extinctions, they are still quite powerful. The Tunguska impactor, for instance, burst about five to 10 kilometers (3-6 miles) in the air above Northern Siberia in 1908, knocking over an estimated 80 million trees in a section of forest over 2150 square kilometers (830 square miles) in size. Image courtesy Stephen Kent.

To sift through the data for NEOs, Kent divided the SDSS data into fields, each covering an area of sky about half the size of the full moon and containing about 1,000 candidate objects of all types. He then designed an algorithm that examined the properties of each object in a field to determine if it met the criteria of an NEO.

To run the application on the grid, Kent bundled several hundred fields together. Each bundle, about two gigabytes or so of data, was submitted as one job to a grid node and took about 12 hours to process. In total, more than 600,000 fields were searched.

Kent then examined the resulting 200 to 300 NEO candidates by eye to eliminate misclassifications and compile the final catalog of around 100.

The NEOs Kent found were all relatively small, ranging in size from about 20 to 200 meters in diameter. Based on his results, Kent was able to estimate the total population of NEOs in the same size range to be around one million. He was also able to estimate the Earth-NEO collision rate — about one every thousand

years — but said that many uncertain factors go into the calculation.

"NEOs are very interesting and important to study because if any of the big ones with diameters several kilometers across collide with the Earth, they can cause all sorts of dramatic effects, such as the impact that led to the extinction of the dinosaurs," Kent said. "Even the smaller ones like the ones

Open Science Grid

Futures – Vision

Open Science Grid

Seeding Expansion in University Campus Grids

~100 US LHC Tier-3s will participate to get data through OSG and run jobs locally and remotely.

New Neescomm (Earthquake shake tables) Community Collaboration sub-committee. 14 equipment sites collect, archive and share data.

Internet2, Educause educate the CIOs, CFOs and Presidents through workshops and “CIDays”.

OSG to participate with TeraGrid Campus Champions.

..... Your ideas ??

The OSG & TeraGrid Mix

- OSG and TeraGrid use same fundamental software.
 - Client/user-side software should be easily adaptable to use both.
 - Several portals access both (Nanohub, RENCi, GIGI)
- To use TeraGrid you need to apply for and be granted an Allocation.
- To use OSG you need to register with a Community or VO. OSG provides some “ready made” VOs:
 - OSGEDU is a VO for Students and Teachers
 - Engage is a VO where we help you get your code to run and then run “helper services” for you to monitor your runs, select sites where your code will run etc.

A National Vision

We (OSG) aim to be a driver for and

An integral part of the

National Cyber-Infrastructure

! With Continued Help and Involvement !

E.g. Smooth support for all scales of parallel jobs

New OSG satellite project to test small-scale parallel jobs that use multiple cores on one CPU-box.

Fills gap between single processor, high throughput, support from OSG and large MPI, high performance, from TeraGrid.

OSCER to be the first site used!

More OSG-TG Collaboration coming? Note words in TG extension project:

- * Continue to support several resources into 2011. This includes the Track 2 systems,
- * Allow high-throughput, Open Science Grid-style jobs.
- * Enable exploration of interoperability and technology sharing.
- * Provide a transition platform for users coming from university- or departmental-level resources.
- * Support unique compute platforms and massive storage systems....

Open Science Grid

Provide software Glue for use of the full suite of computing resources out there

Integrate commercial Cloud computing –Amazon, Google etc.

“No campus left behind”.

Support Virtual Machines of various types.

Bringing in the next generations.

Unique HPC & visualization engines.

Integrate the laptops,iphones..

Shared data repositories & large local data silos.

Data from multi-robots and distributed sensors.
