Oklahoma University, August 2010

Outline

- What do we mean, “Storage Hierarchy?”
- Registers
- Cache
- RAM
- Disk and everything else

EARLHAM

The Analogy

- Imagine sitting on your couch, eating potato chips...

EARLHAM

Intermediate Parallel Programming and Cluster Computing Workshop
Oklahoma University, August 2010

Where are my chips?

- Now: In your hand, about to be eaten
- Soon: In the bag, on the table
- Later: From the kitchen pantry
- Much later: On the shelves, in the store
- Much much later: Shipped from the warehouse
- Even later: Order from the factory, grown at the farm

Storage Hierarchy

EARLHAM
COLLEGE

Intermediate Parallel Programming and Cluster Computing Workshop
Oklahoma University, August 2010

Registers

- Data about to be used *right now*
- Really close to the CPU
- Operands for an operation in register
- Result of an operation stored in register
- Really fast, small, expensive

EARLHAM
COLLEGE

Intermediate Parallel Programming and Cluster Computing Workshop
Oklahoma University, August 2010

Cache

- Data that are likely to be used soon
- On the CPU, so it's very fast.
- Multiple “levels,” each slower but bigger than the last (and cheaper)
- Remember: Faster = More expensive = smaller

EARLHAM

Intermediate Parallel Programming and Cluster Computing Workshop
Oklahoma University, August 2010

RAM

- Data that are being using by program currently running
- This means that data is both in RAM and in Cache (all levels!)
- Much bigger than cache, Much less expensive
- Quick, but still much slower than cache

EARLHAM
COLLEGE

Intermediate Parallel Programming and Cluster Computing Workshop
Oklahoma University, August 2010

Why Cache?

- With the size/speed/cost of RAM, why would we need cache?
- Moving data from RAM to CPU takes hundreds of clock cycles
- Moving data from Cache to CPU takes only 10s or dozens of clock cycles

Disk

- Hard Disks, mechanical storage
- Longer-term storage
- Programs and data that aren't being used right now and likely won't be used soon
- Huge, slow, very cheap
